

# Orthogonal Transformations

- spatial relationships in 3D

Def - An  $n \times n$  matrix  $A$  is an orthogonal transformation I.F.F (if and only if)

- It has  $n$  mutually perpendicular rows or columns with unit length

- $\perp$  rows must be independent (can't be multiples of each other)

ex  $\begin{bmatrix} 1 & 2 \\ 3 & 6 \end{bmatrix} \rightarrow$  linearly dependent

$\begin{bmatrix} 1 & 2 \\ 2 & 6 \end{bmatrix} \rightarrow$  independent but not  $\perp$

- to be perpendicular, the dot product must be 0

dot product:  $x \cdot y = \sum_{i=1}^n x_i y_i$

$x \cdot y = 0 \iff x \perp y$  (perp.)

- rows/columns must have unit length

$\hookrightarrow \|x\| = \sqrt{\sum_i x_i^2} = \sqrt{x \cdot x}$

- The rows or columns of  $A$  form an orthonormal basis of  $\mathbb{R}^n$

- basic for space - set of vectors that can combine to create any vector in a space

- basically first point with more words

-  $AA^T = A^T A = I \rightsquigarrow$  transpose  $[ ]^T$   
switches the rows and columns

ex:  $\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$

more about  $AA^T = A^TA = I$  &  $A^{-1} = A^T$   
mtx mult:  $AB = C$   
 $m \times n$   $n \times k$   $m \times k$   
basically the same info

So what about  $(AB)^T \stackrel{?}{=} C^T$  ~~XXXXX~~

$$AB \neq A^TB^T \quad \text{sad face}$$

$m \times n$   $n \times k$   $n \times m$   $k \times n$   
 $\neq$

$$\text{so } (AB)^T = C^T = B^TA^T$$

$k \times m$   $k \times n$   $n \times m$   
 $\checkmark$

identity matrix

$$I = \begin{bmatrix} 1 & & 0 \\ & \ddots & \\ 0 & & 1 \end{bmatrix}$$

$$\text{so } IA = A$$
$$I x = x$$

example of an orthogonal transformation:

ex •  $2 \times 2$  Rotation matrix:

$$A = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$$

Want to show perpendicular columns:

$$\vec{u} = \begin{bmatrix} \cos \theta \\ \sin \theta \end{bmatrix} \quad \vec{v} = \begin{bmatrix} -\sin \theta \\ \cos \theta \end{bmatrix}$$

Need to show ~~3 things~~...

① are they perpendicular?

$$\text{take } \vec{u} \cdot \vec{v} = -\cos \theta \sin \theta + \sin \theta \cos \theta = 0$$

so we know  $\vec{u} \perp \vec{v}$
