Purpose

This document goes through some simple examples meant to clarify behavior of the Standard CDS and the Standard CDS Converter. It is meant to be used in conjunction with the ISDA CDS Standard Model.

Sections

Standardizing coupon dates

Converter assumptions

Accrued calculations due to Credit Events

Standardizing coupon dates

1. Standard maturity dates are unadjusted – always Mar/Jun/Sep/Dec 20th.

Example: As of Feb09, the 1y standard CDS contract would protect the buyer through Sat 20Mar10.

2. Coupon payment dates are like standard maturity dates, but business day adjusted **following**.

Examples: The 1Q09 payment date is Fri 20Mar09. The 2Q09 payment date is Mon 22Jun09.

3. Coupon payments are also standardized:

- a) Each coupon is equal to $(\text{annual coupon}/360) \cdot (\# \text{ of days in accrual period})$.
- b) The accrual period always stretches from (previous coupon payment date) through (this coupon payment date–1), inclusive; **except** a contract's last accrual period, which ends with (and includes) the unadjusted maturity date.

Example (Table 1): Consider a 1y \$36mm 100bp standard CDS traded in Feb09, maturing 20Mar10:

Coupon	Accrual Start	Accrual End	# Days	Payment	Payment Date
1 st	Mon 22Dec08	Thu 19Mar09	88	\$88k	Fri 20Mar09
2 nd	Fri 20Mar09	Sun 21Jun09	94	\$94k	Mon 22Jun09
3 rd	Mon 22Jun09	Sun 20Sep09	91	\$91k	Mon 21Sep09
4 th	Mon 21Sep09	Sun 20Dec09	91	\$91k	Mon 21Dec09
5 th (final)	Mon 21Dec09	Sat 20Mar10	90	\$90k	Mon 22Mar10

See also the separate table of all 2009-2013 US coupon payment, accrual start, and accrual end dates.

4. Standardizing rates (100/500), coupon payment dates, and accrual start dates maximizes fungibility and ease of coupon processing.

Examples:

- a) Every \$10mm 100bp standard CDS contract will pay the **exact same 2Q09 coupon**, \$26,111, on the **same date**, Mon 22Jun09 – regardless of trade date, maturity, or reference entity. (One exception: any trades maturing 20Jun09, which would pay their final \$25,833 coupon on 22Jun09.)
- b) A \$10mm 100bp 20Mar14 (5y) contract hedged by a \$10mm 100bp 20Mar15 (6y) contract will have exactly offsetting cashflows until the first unhedged coupon, 2Q14 on 20Jun14.

5. A trade's first coupon payment date is determined by the trade date (T): it's the **first coupon payment date after T+1 (calendar, unadjusted)**. This is consistent with the first coupon dates of, eg, CDX.

Examples:

- a) A standard CDS trade on T=Fri 20Feb09 pays its first coupon Fri 20Mar09 (paying annual coupon/360 x 88, as per Table 1 above).
- b) A trade on Wed 18Mar09 also pays its first coupon Fri 20Mar09 – exact same coupon as in (a).
- c) But a trade on Thu 19Mar09 pays its first coupon three months later, Mon 22Jun09 (for 94 days).
- d) Similarly, a trade on Sat 20Jun09 pays on Mon 22Jun09, but a trade on Sun 21Jun09 doesn't pay its first coupon till Mon 21Sep09.

Converter assumptions

- 1. The converter is based on the ISDA CDS Standard Model code, with simpler assumptions. In particular, it assumes a single flat hazard rate rather than a term structure of flat spreads.
- 2. The converter assumes that **credit risk begins at the end of the trade date (T)**. That is, it divides a contract's coupon days – from first accrual start date, to maturity date – into two types:
 - a) **Riskless (aka accrual) days** include the first accrual start date through T. They are assumed to have 0 chance of a credit event. They only contribute to fee through their coupon.
 - b) **Risky days** include T+1 through maturity. They are assumed to have some chance of a credit event, quantified by the flat hazard rate. They contribute to fee through both their coupon and their chance of payout on a credit event. **Points upfront (and clean price)** include only the value of risky days.
- 3. It follows from 2 above that:
 - a) The converter's **fee** (aka price) is dirty: it includes the value of the riskless accrual coupon days.
 - b) The converter's **points upfront** are clean: they exclude the riskless accrued.

Example 1: The CDS from Table 1 above includes 454 coupon days. Suppose it's booked on 20Feb09. Then, 22Dec08-20Feb09 (61 days) are assumed to be riskless, and 21Feb09-20Mar10 (393 days) are assumed to be risky.

Example 2: Now suppose that, later on the day of T=20Feb09, a credit event occurs. The buyer is protected, since the contract takes effect from the moment of the trade confirm (and protects against events 60 days back). The "first day free" assumption that T is riskless is just a converter simplification and does not affect contract terms.

Example: Suppose the CDS from Table 1 is quoted at 2 points upfront. This means:

Buyer pays clean price = $2\% \cdot \$36\text{mm notional} = \720k

Seller pays accrued = $(\# \text{ of riskless coupon days} = 61)/360 \cdot \$36\text{mm notional} \cdot 100\text{bp rate} = \61k

Net, buyer pays **\$659k**.

- 4. When converting between clean points and dirty fee, the converter follows CDSW in making the simplifying assumption that riskless accrued is in settlement date dollars, when in fact it's in next coupon payment date dollars. This is convenient for back-of-envelope, and the omitted discounting is rarely significant.

Example: In 3 above, the quoted clean price of \$720k was reduced to \$659k, to compensate the buyer for paying for 61 days of coupon accrued by the seller. But the buyer will only pay that \$61k at the next coupon payment date (20Mar09). Expressed in settlement date (T+3 = 25Feb09) dollars, the fair value of that future payment is closer to \$60.95k.

Accrued Calculations during Credit Events

1. Upon the occurrence of a Credit Event, the Riskless days are a known number of days.
2. To be fully fungible with contracts traded prior to the Credit Event during the settlement following an Auction, should be calculated on a fixed number of accrued days.
3. Consideration is taken based the relation of the Event Determination Date (EDD), the Trade Date, and the IMM roll date immediately following the EDD.
 - a. If the Trade Date is before the IMM roll date immediately following the EDD, Seller will pay an amount equal to the expected accrued as part of the upfront fee (the exact amount of which Buyer will eventually pay as part of the Auction Settlement).
 - b. If the Trade Date is after the IMM roll date immediately following the EDD, Buyer will pay an amount equal to the expected accrued as part of the upfront fee (the exact amount of which the Seller will pay as part of the Auction Settlement as a rebated amount). Such expected accrued also takes into account future IMM rolls as part of the upfront fee; this is based on the possibility that a Credit Event crosses more than one IMM roll prior to Auction Settlement.

Example 1:

Ambac EDD: 9 November 2010

Auction: 10 December 2010

For reference, during Auction Settlement, the Buyer of a contract that was traded prior to the EDD would have paid 51 days accrued to the Seller as part of the Auction Settlement.

- a) Assume a standard contract was executed on 10 November, such standard contract would have accrued 52 days under current mechanics.
- b) During Auction Settlement, only the 51 days of accrued would be paid, creating a one day shortfall of accrued.

By defining an EDD through the converter, one can define the correct period of days for upfront purposes, eliminating shortfalls.

Example 2:

Japan Airlines EDD: 19 January 2010

Auction: 22 April 2010

For reference, an IMM roll occurred before the Auction. Two sets of accrued calculations will apply, each dependent on the Trade Date.

- a) If the Trade Date occurred on 15 March 2010, the Seller would pay an amount equal to 30 days of accrued in the upfront calculation, the period between 21 December 2009 and 19 January 2010.
 - a. Buyer then pays a full 92 day period for the IMM roll
 - b. Seller then pays a 62 day rebate to the Buyer during Auction Settlement.
- b) If the Trade Date occurred on 30 March 2010, the Buyer would pay an amount equal to 62 days of accrued in the upfront calculation, the period between 22 March 2010 and 19 January, 2010.
 - a. Seller pays a 62 day rebate to the Buyer during Auction Settlement.
