May 6, 2024

Abstract

A new type RepeatableIterable for Python and a way to obtain one instance

Current version: 2024-05-06

Current number of commits: 34

Current git SHA1: c0a2ace995c07378abd86152f08aa723acbeb7cc

Code lines: 1830 total lines, 1552 not empty lines, 278 empty lines.

16
17 | **A new type RepeatableIterable for Python** |
18 | :-----: |
19 |      **and a way to obtain one instance**      |
20
21
22 Since in Python an Iterator is an Iterable
23 and that you cannot iterate multiple times on an iterator,
24 you may encounter WTF bugs, even with type checking.
25 This package provides possible solutions to this problem.
26 See here for a discussion on this problem:
27 <https://stackoverflow.com/questions/63104689>
28 (/what-is-the-pythonic-way-to-represent-an-iterable
29 -that-can-be-iterated-over-mult).
30
31 Before:
32 ````python3
33 def foo(iterable: Iterable):
34     for that in iterable:
35         bar(that)
36     for that in iterable:
37         # possible bug
38         baz(that)
39
40 foo(something)
41 ````

42
43 After solution 1:
44 ````python3
45 from python_repeatable_iterable import RepeatableIterable
46
47 def foo(iterable: RepeatableIterable[object]):
48     for that in iterable:
49         bar(that)
50     for that in iterable:

```

```

51         baz(that)
52
53 something_else = RepeatableIterable(something)
54 foo(something_else)
55     ^
56
57 After solution 2:
58     '''python3
59     from python_repeatable_iterable import RepeatableIterable
60
61 def foo(iterable: Iterable):
62     iterable = RepeatableIterable(iterable)
63     for that in iterable:
64         bar(that)
65     for that in iterable:
66         baz(that)
67
68 foo(something)
69     ^
70
71 If you develop something where you have no control on
72 what another dev might give you as input,
73 you have 2 possibilities:
74
75 - hope for the best ;),
76 - or harden your code to have less support work to do :).
77
78 This applies if you dev something that is:
79
80 - closed source or open source,
81 - available to everyone on the Internet,
82   available only to customers or colleagues
83   that you may personally know or not.
84
85 Solution 2 above is a nice solution
86 with a reasonable performance cost :).

25 from typing import Iterable, NewType, Type
26 from _collections_abc import dict_keys, dict_values, dict_items
27 from python_none_objects import NoneIterable
28
29 A first attempt at defining the RepeatableIterable type,
30 but it is not generic.
31 It defines a RepeatableIterable() function that cannot be subscripted.
32 RepeatableIterable = NewType("RepeatableIterable", Iterable)
33 -----
34 -----
35
```

```

36 The following function is a first attempt
37 that conveys the intent more clearly.
38 But it is not safe, see discussion just after.
39 def get_repeatable_iterable(
40     iterable,
41     safe_classes: Iterable[Type] = NoneIterable,
42 ) -> RepeatableIterable:
43     if isinstance(
44         iterable,
45         (
46             list,
47             tuple,
48             range,
49             str,
50             bytes,
51             bytearray,
52             memoryview,
53             set,
54             frozenset,
55             dict,
56             dict_keys,
57             dict_values,
58             dict_items,
59         ),
60     ):
61         return iterable
62     if isinstance(iterable, safe_classes):
63         return iterable
64     return list(iterable)
65
66 Indeed this function is not safe, since you can subclass builtins
67 or other classes to make them not RepeatableIterable
68 from the point of view of the semantic of this type.
69 Consider the following code for example:
70 >>> class MySet(set):
71 ...     def __init__(self, *args, **kwargs):
72 ...         super().__init__(*args, **kwargs)
73 ...         self.iteration_count = 0
74 ...     def __iter__(self):
75 ...         self.iteration_count += 1
76 ...         if self.iteration_count == 1:
77 ...             return super().__iter__()
78 ...         return ()).__iter__()
79 ...
80 >>> s = MySet('abcd')
81 >>> for x in s: print(x)

```

```

82     ...
83     b
84     a
85     d
86     c
87     >>> for x in s: print(x)
88     ...
89     >>> for x in s: print(x)
90     ...
91     >>> isinstance(s, set)
92     True
93
94     See here a list of builtins that can be subclassed or not:
95     https://stackoverflow.com/questions/10061752
96     /which-classes-cannot-be-subclassed
97
98 -----
99
100    This second attempt has been included in the class RepeatableIterable.
101    def get_repeatable_iterable(
102        iterable: Iterable,
103        safe_classes: Iterable[Type] = NoneIterable,
104    ) -> RepeatableIterable:
105        # Here is an implementation avoiding the previous problem.
106        iterable_type = type(iterable)
107        for some_class in (
108            list,
109            tuple,
110            range,
111            str,
112            bytes,
113            bytearray,
114            memoryview,
115            set,
116            frozenset,
117            dict,
118            dict_keys,
119            dict_values,
120            dict_items,
121            *safe_classes,
122        ):
123            if iterable_type is some_class:
124                return iterable
125        return list(iterable)
126    """
