

Practical 3

Jumping Rivers

Question 1

Start with the following function definition:

```
def Fun4(x):  
    if x == 5:  
        y = 0  
    else:  
        y = 1  
    return y
```

1. Change `Fun4` so that it:

- returns 1 if x is positive;
- returns -1 if x is negative;
- returns 0 if x is zero.

2. Without using python, what do you think the value of `y` will be after these two lines of code?

```
y = 0  
Fun4(10)
```
