

What is Aloha Editor?

Aloha Editor is a semantic Rich Text Editor framework written in Javascript with best support of xHTML5. You can integrate it in a CMS, blog, wiki software or any other project where you need to edit content with a web based tool. Use it like a **supersonic textarea**. You can edit [almost any DOM element](#) with this supersonic textarea, but you need to care about configuration and storage.

What Aloha Editor is NOT!

Aloha Editor is NOT a HTML Editor to install on a desktop nor it is a CMS.

Why the HTML5 Editor?

Aloha Editor makes
CONTENT
in your browser
EDITABLE

Aloha Editor works perfectly in all current browsers and websites using HTML4! It is the HTML5 Editor because it [implements all functionality](#) respecting with no compromise the [HTML5 specification](#). It

aims to generate **full compliant xHTML5 content**, but you don't need to use HTML5 specific methods, if you don't want to. The Aloha Editor uses and extends the attribute [contenteditable](#), which was introduced in the HTML standard with version 5. Most current browsers support that attribute, but their implementation is inconsitent due to erroneous implementations and the lack of detail of the HTML5 specification when it comes to DOM manipulation. Aloha Editor makes contenteditable useable.

The Aloha Spirit

Aloha is about passion! The Aloha Editor is designed and made with passion from real passionate people. Aloha Editor's vision is to edit anywhere. We move the user to the center of everything. Every action should be completed with the minimum possible interactions. Everything that can be done automatically should be done automatically. All interactions should react in realtime and give immediate clear feedback to the user. The user should see the exact result of its action immediately. No apply or confirm action should be necessary. It's done when you do it. Instead everything can be reverted.

Why Aloha?

"Clemens and I started the project on January 18th. We wanted to build the
